Mac commands

Tuesday, September 9, 2025   2:32 PM

Basic Zsh Commands

- ls – List files and directories
- cd <directory> – Change directory
- pwd – Print working directory
- mkdir <name> – Create a directory
- touch <file> – Create a file
- rm <file> – Remove a file
- cp <source> <destination> – Copy files
- mv <source> <destination> – Move or rename files
- cat <file> – View file contents
- echo "text" – Print text to terminal

Aliases

Create shortcuts for commands: **alias gs='git status'**

Add these to your .zshrc to make them permanent.

🙇 **Heads-up: Microsoft M365 Copilot App Blocked on macOS Starting Sept 17**
Hi everyone,
Starting **September 17**, we're **temporarily blocking the Microsoft M365 Copilot application on macOS devices**.
🛑 **Why the block?**
Microsoft currently does **not support restricting sign-ins by individual email IDs** within the macOS app.
👉 This limitation prevents us from enforcing necessary access controls, which are **critical for maintaining our security and compliance standards**.
💻 **What's still available?**
✅ The **web-based version of Copilot is not impacted** — you can continue using it as usual.
🔧 **What's next?**
We're working **closely with Microsoft** to get the required configuration in place. Once available, we'll **remove the restriction** and make the app available for everyone to install and use.
We appreciate your understanding and patience as we work toward a secure and inclusive rollout of this powerful tool.
